

Desktop laser

Logitech has announced the Cordless Desktop MX 5000 Laser, featuring a built-in LCD screen on the keyboard to help manage a constant flow of information.

The screen can display email and instant message notifications, favourite playlists and internet radio stations.

By displaying information such as the status of the caps lock and F lock keys, volume levels and mute, the keyboard also alleviates visual clutter that would ordinarily be displayed on the computer monitor.

The keyboard is more than just an input device: it can send and receive information to and from the computer, making it a smart device, and can also turn a PC into a Bluetooth wireless hub, as it features the new Bluetooth 2.0 Enhanced Data Rate wireless.

PCB checks improved

Huntron has available hardware and software improvements for its ProTrack Prober product range.

A high resolution colour camera system is now standard on the renamed Prober IIc and Prober IIIc. Additionally, the Huntron Workstation Software version 3.4 includes an interface to the Router Solutions CAMCAD suite. The improvements enhance user's ability to diagnose and troubleshoot printed circuit cards.

The camera was a result of user requests and improves visibility when navigating around the UUT. The picture displayed from the camera system can also assist the operator with visual inspection of the area under test.

Adding Huntron CAD and RSI's CAMCAD tools to the workstation software enhances test building and fault isolation. The HAF (Huntron ASCII file) Assist interfacing and RSI CAMCAD convert PCB layout files into a standardised ASCII HAF Huntron for import into the workstation software.

This also creates a CC (CAMCAD) file that contains the PCB CAMCAD layout information. HAF Assist runs in conjunction with CAMCAD and provides shortcuts to panelisation, DFT, component pin offsetting, test point creation and alignment point selection while still allowing full access to all the features of CAMCAD.
